Primary Research and Clinical Interests

Over the past 25 years, I have gained expertise in the analysis of psychological data for complex designs (e.g., clustered, longitudinal, multilevel), employing multiple analytic methods—including but not limited to latent variable, mediation, moderated mediation, time-varying effects models, and causal models. Most recently, I have gained expertise in techniques for harmonizing data at the item level across multiple studies, which may have utilized different study designs (e.g., randomized control trials [RCTs], observational studies), assessment schedules (e.g., annual versus biannual assessments) and measures.

As an applied quantitative psychologist, I seek to utilize advanced analytical methods to both prevent and mitigate the impact of risk factors facing children and families – to ultimately improve family functioning and child and adult outcomes. Broadly, my research aims to understand changes in human behavior, biological and physiological processes, and examine how familial, contextual, and psychosocial factors may account for such changes. Further, I am interested in evaluating (a) the impact of parent-mediated preventive interventions designed for families and youth with child welfare system involvement; (b) whether culturally-specific adaptations made to interventions can better meet the needs of underserved populations who are overrepresented in the child welfare system; and (c) whether scaling-out and adapting interventions for families experiencing informal kinship care can prevent problems before they raise to the level where child welfare system involvement is necessary.
